

## CASE STUDY

# Floor Preparation

## Hospital basement floor

We have just completed a concrete floor preparation project which was in a hospital basement. We were asked to remove the contaminants which included paint and resin from the floor of what was once a staff room in the hospital.

By using the latest diamond grinding technology, we were able to remove the stubborn top surface of the concrete, leaving the substrate fully prepared for its new coating.

Concrete floor preparation is a specialist contractor project. Requiring heavy equipment, knowledge of the work and the right environment, the surface is not only prepared but all dust and particles must be removed from the site.

Diamond grinding technology provided by [Grit Blasting UK](http://www.gritblastinguk.co.uk).  
Details on our [surface preparation work and video available](#) here.
